1. Role and contribution

Describe your role and responsibilities in the group and the most important contributions to the result, the goal, the planned activities and the documentation that you have made (or intend to make). What modules and components (IMPORTANT) are you responsible for designing or developing? Did you contribute to all chapters in the project report, including the final discussion and conclusions?

My role and responsibilities has been to contribute more on the technical part of the project, more specifically designing and coming up with ideas as to how we are going to solve the problem, and backend. For example, the modules I came up with was that we have a "layout builder" in our application (only for admins). Another module I thought of that we have implemented was that the layout builder is a 2d grid with x and y coordinates that you can place out desks, walls, chairs, and much more. Below you see a more detailed picture of what I mean. I have so far contributed to section 5 Implementation/Design and part of the report where we speak about the technical parts of the report. I have also contributed to section 7 Discussion where I discussed: Analysis and discussion of results.

2. Course objectives and new knowledge

How have you reached (or intend to reach) each of the course objectives/learning outcomes (IMPORTANT) as stated in the syllabus of your version of the course? Describe also what other new knowledge and practical skills you have gained (or intend to learn). Give concrete examples of knowledge from previous courses that you have applied and extended (or intend to apply), and how.

I would say that I have reached each of the course objectives and learning outcomes. I have gotten a deeper understanding of React and Python, as well as deeper understanding of FastAPI and how it speaks with the server and responds with JSON. Examples of concrete previous knowledge is Database modelling that we had in our 2nd year. Another example is the implementation of the 2d grid in the layout builder, this I learned in Object Oriented programming in C++ our 1st year and it's where I got the idea from. The web programming course we had in our 2nd year has also been good for this project because it taught me front and backend development how the frontend speaks with the backend, also basic understanding of APIs. Personally I would say that I have reached every objective stated in the syllabus. This project has been super fun to work in and the group is amazing, as well as the company. Very nice of them to let us sit in their office throughout the entire project, they have been treating us very good with lunches and fika as well as compensation for our work.

3. Methods

Document and analyze your use of methods and tools, and suggest how to improve this. Reflect on how you applied agile practices (e.g. iterations, feedback, adaptation) to adjust your way of working. Describe how you cooperated with others to ensure that your contribution was integrated and aligned with the team's overall work, and how this can be improved.

Since we have started developing our solution, we have mostly been using GitHub to push our code into the project repository. Since we have been working as a team it is very important to have good communication when pushing code, especially when using branches and merging. Making sure there are no merge conflicts etc. Other than that, we have been using Word to write the report. We have also been using AI, especially Claude Code, it has been a very useful tool for us to use while developing this project.

4. AI usage

To what extent have you used generative AI? What concrete methods have you used to verify AI generated content and to develope an understanding for it? Did it produce incorrect results? Have you also made an attempt yourself and compared the result?

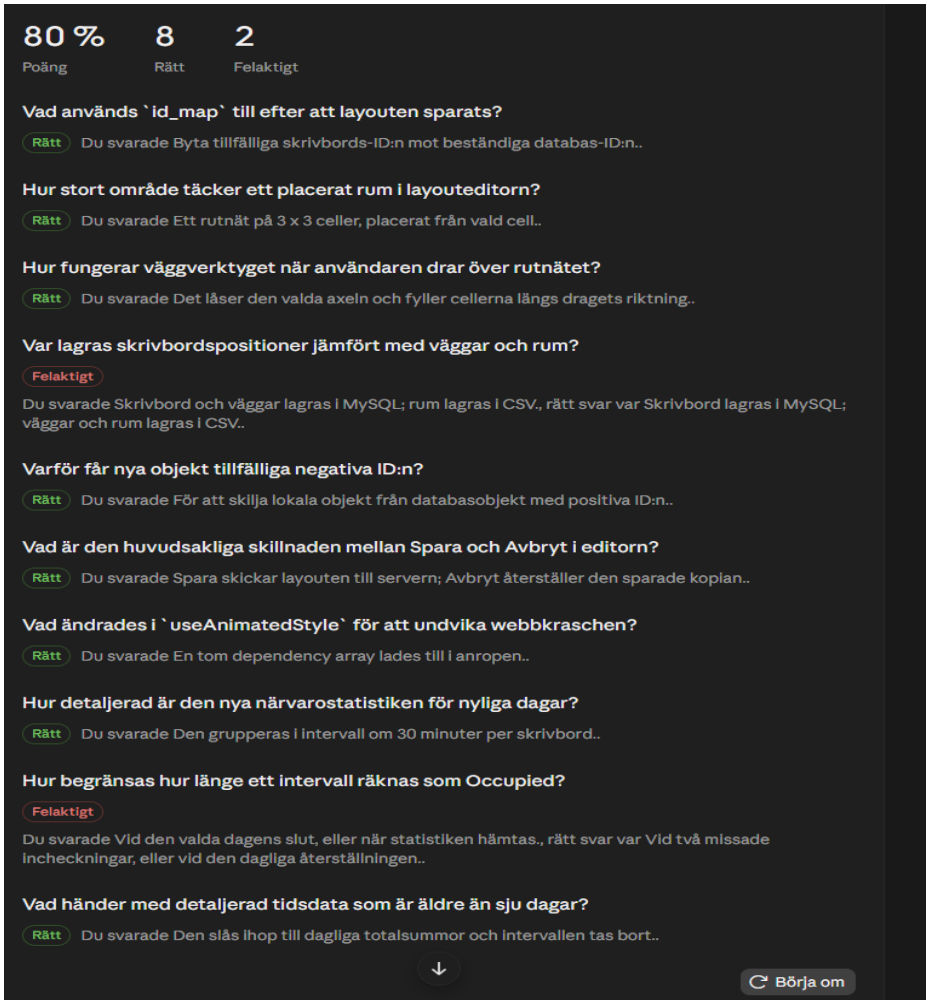

I have used AI to generate the quiz based on my commits. I used Claude Code to generate the quiz. Since I based my questions on my commits, the questions and multiple choice answers were concrete and relevant to the commits. I have also used Visual Studio Codes built in AI (Co-Pilot) for debugging the code that was written. We as a group have also used AI to generate images for the PowerPoints and pictures that we have used in the report.

5. AI generated quiz (only in 2nd reflection)

Before the second individual reflection, upload substantial parts of your program code, AI-generated content, or other own advanced development results to an AI tool. Prompt the AI tool to use this material to generate ten multiple-choice questions that test your understanding of your own contribution. Complete the quiz until you answer at least eight out of ten questions correctly.

Example prompt: "Create 10 multiple-choice questions [in Swedish/English] based on the attached material to test my understanding of my own contribution. Include questions both about detailed aspects and about the purpose, context, overall design, risks and limitations of the work. Keep all answer options for each question approximately the same length. Do not reveal the correct answer before I respond. Present one question at a time, evaluate my answer, and keep track of my score."

In the second individual reflection, show the prompt you used, describe the material, and include a screenshot showing your final score. Give a few examples of questions that revealed gaps or uncertainties in your understanding and briefly explain what you learned from them. Reflect on the correctness of the AI response.

I have generated these questions based on my commits into the repository for our project on GitHub. I asked the built in AI (Co-Pilot) in Visual Studio Code to go through my commits and create questions based on my contributions to the project, then I asked Claude Code to create a quiz. As you can see in the picture above, I got 80% which is the minimum to pass. I did this quiz twice before reaching 80%. The prompt I used is the one given to us, the example prompt above. The correctness of the AI is 100%, I double checked.

6. Attendance

What is your team meeting frequency? Have you been present and active at more than 80% of the team meetings and 80% of the course seminars? If not, what written additional assignments have you done (or intend to do) in agreement with the group or supervisor that would contribute to the group result and to your learning?

Our teams attendance is still very good! We are at the office almost everyday, except weekends, and if someone needs to take a day off or has something planned then we are very good at communicating it with the group. My personal attendance has also been good, I would say that I am with the group atleast 80% of the time.
